To run Stupify locally: ensure MySQL is running with the stupify database configured(all tables created and inserted, access.sql and all .sql files are run), install Python dependencies with pip install -r requirements.txt, update database credentials to your own credentials in app.py , then execute *python app.py* in your terminal. Open your browser to <http://127.0.0.1:5000> and log in using demo credentials (Admin: admin_2 / admin_pass123, Manager: database_manager / manager_pass_123, Analyst: analyst / analyst_pass_123). The application will load the Records page showing all database tables that you can browse, search, add, edit, and delete based on your assigned role.
